

INSTRUCTIONS ON HOW TO CREATE CORRECT FILE FOR HIGH QUALITY POSTER PRINTING

The following instructions are designed to help you create a proper printing file. If still in doubt, please download the template, visit our web site at the FAQ section, activate the File Verification with an operator or call our Support Service.

1 FILE FORMAT

Our systems only process PDF format files - not password protected.

2 TEMPLATE

During the customisation phase of sizes on the web site, our system automatically creates a PDF template. We recommend to download file, add your own graphic, eliminate all guide lines except for the green ones and save it again in PDF. This way the saved file will be correct. Be careful not to place graphics in the bleed area, as they will not show on the finished product.

3 COLOUR

The same colour can appear slightly different depending on the printing media. This is due to the material physical composition. All the colours are in CMYK (Cyan, Magenta, Yellow and Black) with the printing profile in Fogra 39. Images in RGB or with PANTONE colours shall be automatically converted with the standard separation profile.

4 RESOLUTION

The best resolution for the printing file is 300 dpi.

5 ADDITIONAL INFORMATION

Minimum printing line weight is 0.5pt.

6 MARGINS AND BLEED AREA

High quality Posters require a PDF file in 1:1 scale +1 mm bleed area on each side. Distance of texts from cutting border must be 3 mm.
